                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            144 Gluasp-----LeuPheLysLeuGlyGluProTyrHisLysLysGluHisTyrLeuSer 161
                                                                                                                                                     The present invention describes a method (M1) for screening for an anti-neoplastic agent. The method involves exposing cells to a chemical agent to be tested for anti-neoplastic activity, determining a change in expression of at least one gene [1] of a signature gene set, where [1] comprises a sequence (S) selected from 8447 sequences (given in ABL61664 to ABL7010), or is at least 95% identical to (S), where a change in expression is indicative of anti-neoplastic activity. (I) has cytostatic activity and can be used in gene therapy. M1 can be used for screening an anti-neoplastic agent, and can be used for producing a product which is the data collected with respect to the anti-neoplastic agent as a result of M1, and the data is sufficient to convey the chemical structure and/or properties of the agent. M1 can be used in the

Sequences ABBA08224 represent 1390 nover number polypepticus, and sequences ABBA08224 represent 1390 nover number of invention also relates to vectors and recombinant host cells comprising a nucleotide of the invention, methods of producing the novel polypeptides, antibodies against the polypeptides, methods of detecting the nucleotides or polypeptides in a sample, and methods of identifying compounds which bind to polypeptides of the invention. Although novel, many of the polypeptides of the invention have homology to known proteins, thereby giving an insight into their probable biological activities, and hence potential therapeutic applications. The polypeptides of the invention may have arious activities, including cytokine, cell proliferation or cell differentiation activities; stem cell growth activity; haematopoiesis regulatory activity; tissue growth activity; haematopoiesis regulatory activity; tissue growth activities; chemotactic or chemokinetic activities; haemostatic, thrombotic or thrombolytic activities; receptor or ligand activities; or may be compensed, cancer cell proliferation or metastasis.

Communomention are useful for preventing, treating or ameliorating medical involved in oncogenesis, cancer cell proliferation or metastasis.

Conditions, e.g., by protein or gene therapy. Such conditions include concers, haematopoletic disorders (e.g., myeloid or lymphoid cell disorders), chronic inflammatory conditions (e.g., asthma or arthritis), cronicars haematopoletic disorders (e.g., myeloid or lymphoid cell cancers, haematopoletic disorders (e.g., myeloid or lymphoid cell carterial ischaemia, bone disorders (e.g., myeloid or lymphoid cell carterial ischaemia, bone disorders (e.g., myeloid or promote wound createrial growth. Polypeptides involved with tissue regeneration and repair (or nucleic acids encoding them) may be used to promote wound

α RESULT

Sequences ABB10981-ABB12330 represent 1350 novel human polypeptides,

```
cc healing (e.g., of burns, incisions and ulcers), while those with immunomodulatory activities may be used in the treatment of viral, bacterial and fungal infections in addition to immune disorders.

CD Descerial and fungal infections in addition to immune disorders.

CC POLYPEPPIGES With growth factor activity may be used in cell cultures to promote cell growth. For example, such polypeptides may be used to manipulate stem cells in culture to give rise to neuroepithelial cells that can be used to augment or replace cells damaged by illness,

CC autoimmune disease or accidental damage. The polypeptides and nucleotides

CC autoimmune disease or accidental damage. The polypeptides and nucleotides

CC autoimmune disease. The present sequence represents a cDNA encoding a cover human polypeptide of the invention.

                                                                                                                                                                                                                                                  The present invention provides the protein and coding sequences of nove-
proteins from a variety of organisms, including human, dog, cat, horse,
cow, pig, hamster, monkey, macaque, yeast, bacteria, fruit fly, sea
urchin and tomato. These were derived from expressed sequence tags (EST)
from the organism of interest. They can be used in diagnostics,
forensics, gene mapping, identification of mutations, to assess
biodiversity and for nutritional purposes. The present sequence is a cD

Sequences ABB10981-ABB12330 represent 1350 novel human polypeptides, and sequences ABA0825-ABA09574 represent nucleic acids encoding them. The invention also relates to vectors and recombinant host cells comprising a nucleotide of the invention, methods of producing the novel polypeptides, antibodies against the polypeptides, methods of detecting the nucleotides or polypeptides in a sample, and methods of identifying compounds which bind to polypeptides of the invention. Although novel, many of the polypeptides of the invention have homology to known proteins, thereby giving an insight into their probable biological activities, and hence potential therapeutic applications. The polypeptides of the invention may differentiation activities; including cytokine, cell proliferation or cell differentiation activities; stem cell growth factor activity; chammloomodulatory activity; tissue growth activity; immunomodulatory activity; activin- or inhibin-related activities; chemotactic or chemokinetic activities; hemostatic, thrombotic or thrombolytic activity; activin- or inhibin-related activities; chemotactic or chemokinetic activities; hemostation or metastasis.

CC thrombolytic activity; activin- or inhibin-related activities; or may be invention are useful for preventing, treating or ameliorating medical conditions, e.g., by protein or gene therapy. Such conditions include conditions, e.g., by protein or gene therapy. Such conditions cancers, haematopoietic disorders (e.g., my my load or lymphoid cell disorders), chronic inflammatory conditions (e.g., asthma or arthritis), proliferative retinopathy, atherosclerosis, coronary heart disease,

arterial ischaemia, bone disorders (e.g., osteoporosis), and abnormal vascular growth. Polypeptides involved with tissue regeneration and repair (or nucleic acids encoding them) may be used to promote wound healing (e.g., of burns, incistons and ulcers), while those with immunomodulatory activities may be used in the treatment of viral, bacterial and fungal infections in addition to immune disorders. Polypeptides with growth factor activity may be used in cell cultures to promote cell growth. For example, such polypeptides may be used to manipulate stem cells in culture to give rise to neuroepithelial cells autoimmune disease or accidental damage. The polypeptides and nucleotides may also be used in the dispnosis of the above conditions, and in drug screening techniques. The present sequence represents a cDNA encoding a novel human polypeptide of the invention.

Plexins are large transmembrane proteins whose extracellular domain shares homology with Scatter factor receptors and contain an approximately 500 amino acid Semaphorin Gomain. The plexin polynucleotides and polypeptides, and plexin-specific binding agents are useful in diagnosis, therapy and in the biopharmaceutical industry. In particular, the plexin polynucleotides and polypeptides are useful for generating compounds (e.g. plexin-specific binding agents or antibodies) for treating or diagnosing a disease or disorder involving aberrant cell growth (e.g. hyperplasia, neoplasia, cancer or neurodegenerative disease), or diseases or disorders involving aberrant bowel disease or biabetes Type I), or immunosuppressive diseases such as lupus, inflammatory bowel disease or biabetes Type I), or immunosuppressive diseases such as multiple sclerosis or rheumatoid arthritis.
                                                                                                         cancer;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New plexin polynucleotides and polypeptides, useful in diagnosis, therapy and in producing compounds for treating diseases involving aberrant cell growth (e.g. cancer) or immune regulation (e.g.

```
The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving to restore normal activity of (II) or to treat disease states involving to restore normal activity of (II) or to treat disease states involving a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating. The polypeptide and polynuclectide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations creaponsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. AAS64197-AAS94564 represent novel human cream of the produce data for this parent directly from WIPO specification, but was obtained in electronic format directly from WIPO
                                             New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         at ftp.wipo.int/pub/published_pct_sequences.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    proteins whose extracellular domain shares homology with Scatter factor receptors and contain an approximately 500 amino acid Semaphorin domain. The plexin polynucleotides and polypeptides, and plexin-specific binding agents are useful in diagnosis, therapy and in the biopharmaceutical fludustry. In particular, the plexin polynucleotides and polypeptides are useful for generating compounds (e.g. plexin-specific binding agents on antibodies) for treating or diagnosing a disease or disorder involving neurodegenerative disease), or diseases or disorders involving aberrant fumune regulation (e.g. hyperplasia, neoplasia, neoplasia, inflammatory bowel disease or biabetes Type I), or immunosuppressive diseases such as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The sequence encodes Human Plexin-B3. The invention relates to primers for synthesising full length cDNA clones. 830 cDNA molecules encoding a human protein have been isolated and nucleotide sequences of 5' and 3'-ends of the cDNA molecules have been determined. Primers for synthesising the full length cDNA are useful for clarifying the function of the protein encoded by the cDNA. The full length clones were obtained by construction of full length enriched cDNA libraries that were synthesised by the oligo-capping method. The primers enable the production of the full length cDNA easily without any special methods. The present sequence is a human cDNA easily
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Note: The sequence data for this patent did not form part of the printed specification, but was obtained in CD-ROM format directly from EPO.
